Fundamental, Forward & First

瑞領科技公司 台灣楊梅幼獅廠

土地面積：4500 m²

廠房面積：6600 m²

瑞領科技公司簡介

- 瑞領公司目前廠房約6600 m²
- 研發能力：擁有2000 m²實驗室
熱傳實驗室，流力實驗室，光學實驗室，
化學實驗室，相變化實驗室。
- 生產能力：自有各種生產工場2500 m²
各種CNC加工設備-車、銑、放電、雷射，
板金工場，焊接結構工場，烤漆表面處理
工場，電氣、裝配工場。
- 相關熱傳研究設備研發100種以上

AMCA 210規範腔體配置 Outlet (Fig.12) & Inlet (Fig.15)

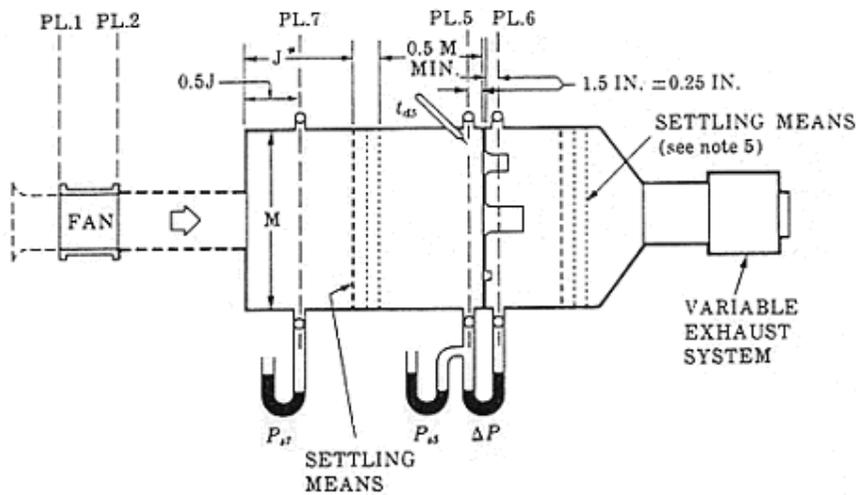

Figure 12 Outlet Chamber
ANSI/AMCA STANDARD 210-85

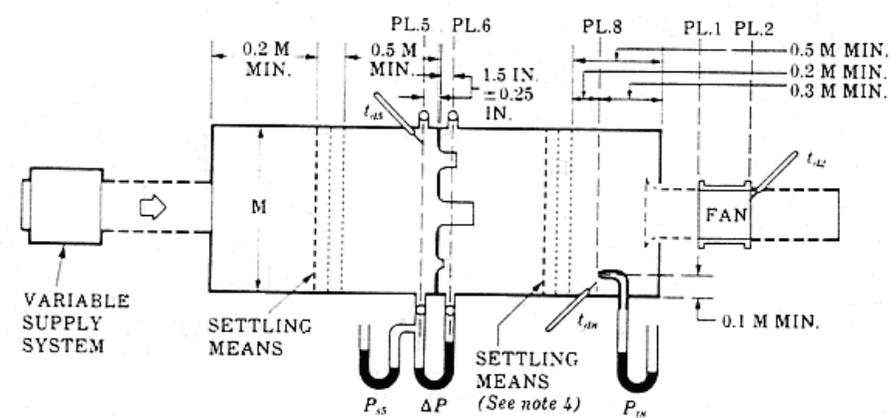

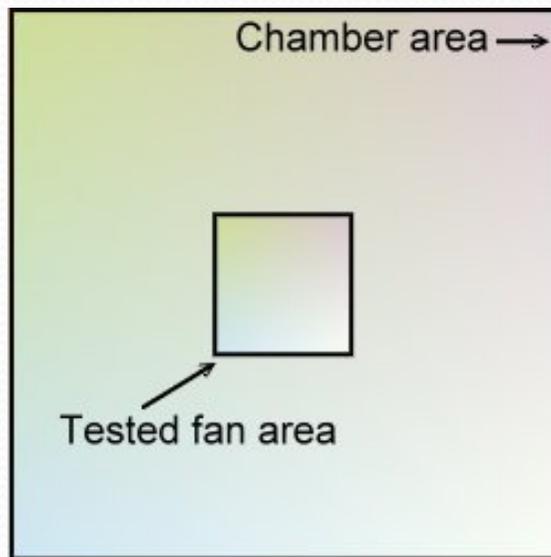

Figure 15 Inlet Chamber
ANSI/AMCA STANDARD 210

AMCA 210 風洞設計標準

Outlet Chambers

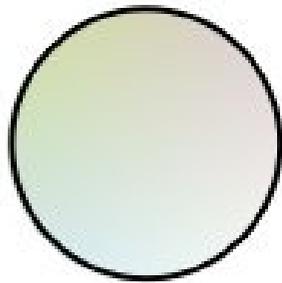

An outlet chamber (figure 12) shall have a cross-sectional area at least **nine times** the area of the fan outlet or outlet duct for fans with axis of rotation perpendicular to the discharge flow and a cross-sectional area at least **sixteen times** the area of the fan outlet or outlet duct for fans with axis of rotation parallel to the discharge flow.

Inlet Chambers

Inlet chambers (Figure 15) shall have a cross-sectional area at least **five times** the fan inlet area.

From AMCA 210-99 page10

AMCA 210 風洞設計標準

different chamber shapes

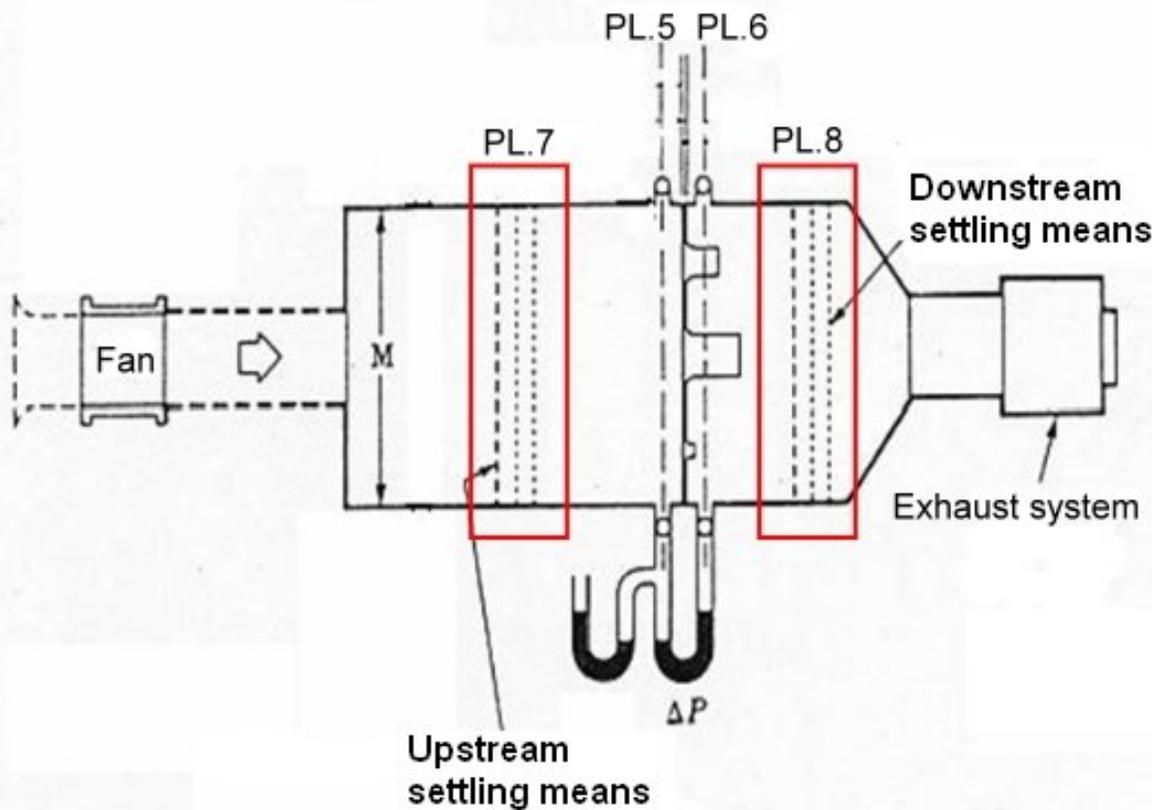

A chamber may have a **circular** or **rectangular** cross-sectional shape.

The dimension M in the test setup diagram is the inside diameter of a circular chamber or the equivalent diameter of dimensions a and b where

$$M = \sqrt{\frac{4ab}{\pi}}$$

From AMCA 210-99 Page10

AMCA 210 風洞設計標準

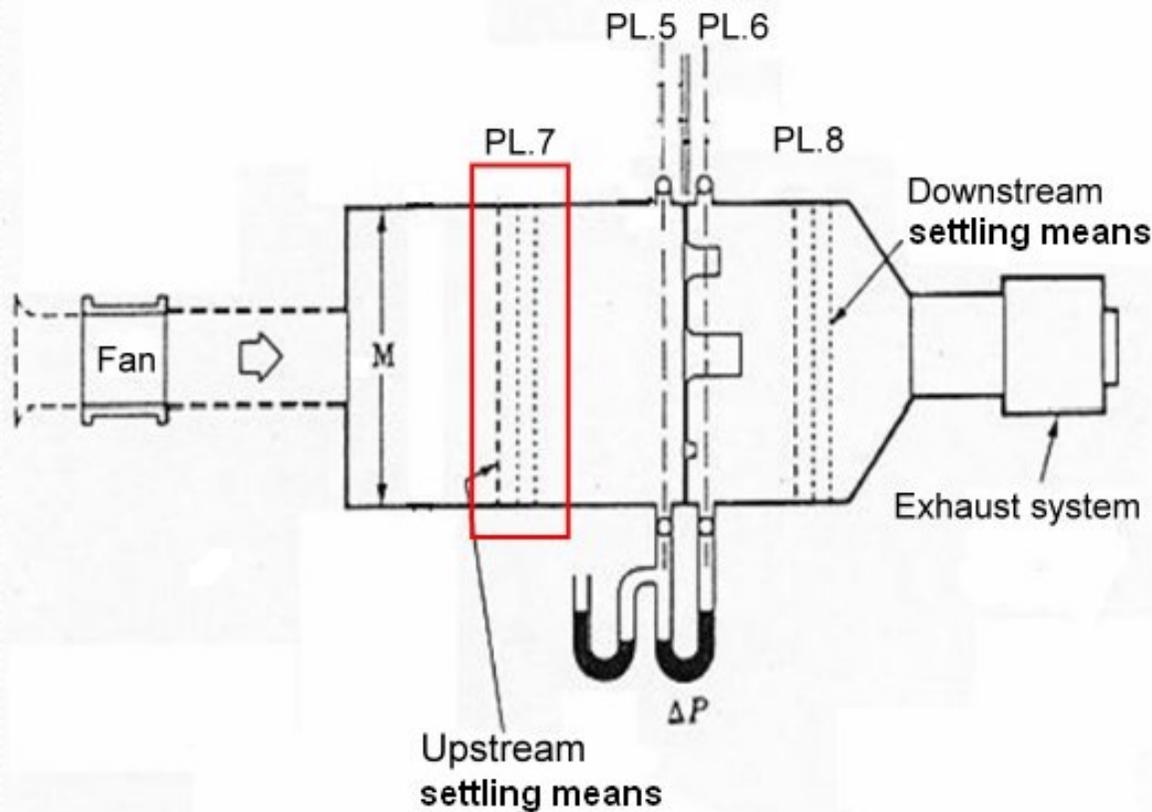

Any combinations of screens or perforated plates that will meet these requirements may be used, but in general a reasonable chamber length for the settling means is necessary to meet both requirements.

Screens of square mesh round wire with open areas of 50% to 60% are suggested and several will usually be needed to meet the above performance specifications.

A performance check will be necessary to verify the flow settling means are providing proper flow patterns.

From AMCA 210-99

AMCA 210 風洞設計標準

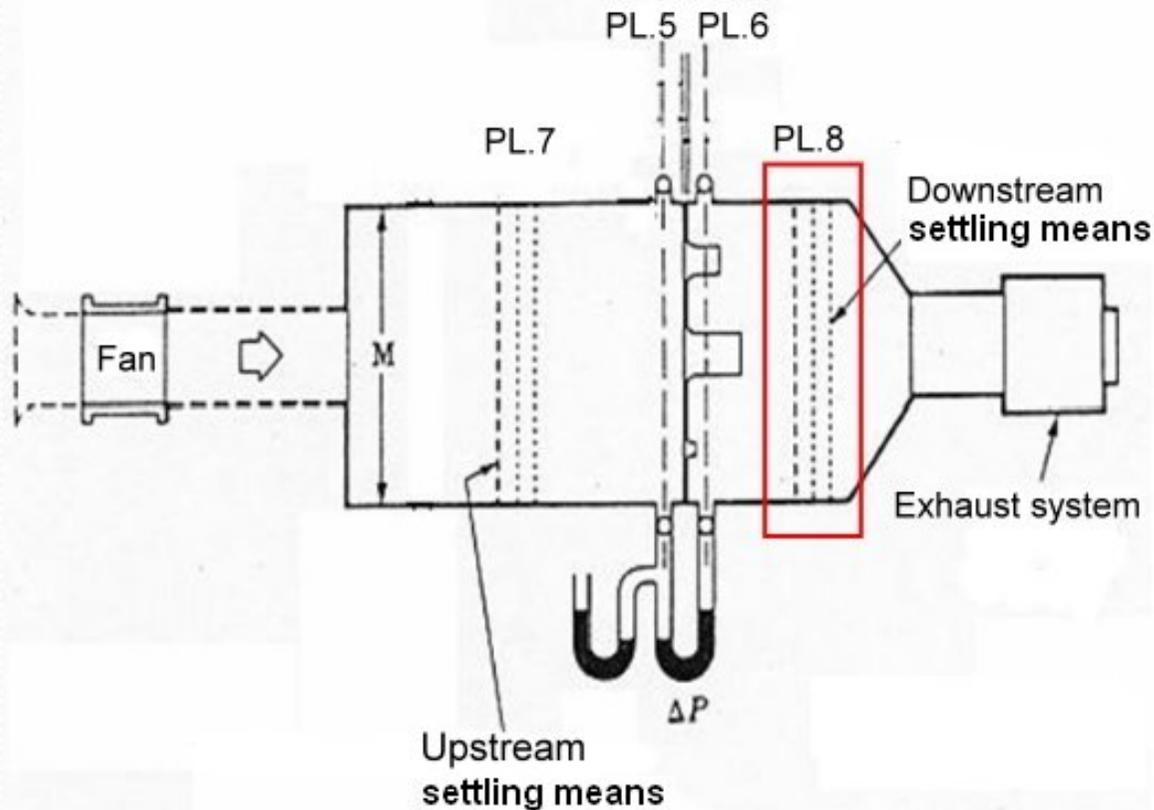

Upstream Settling Means

Where a measuring plane is located upstream of the settling means, the purpose of the settling screen is to absorb the kinetic energy of the upstream jet, and allow its normal expansion as if in an unconfined space.

From AMCA 210-99

AMCA 210 風洞設計標準

Downstream Settling Means

Flow settling means shall be installed in chambers where indicated on the test setup figures to provide proper airflow patterns.

Where a measuring plane is located downstream of the settling means, the settling means is provided to ensure a substantially uniform airflow ahead of the measuring plane.

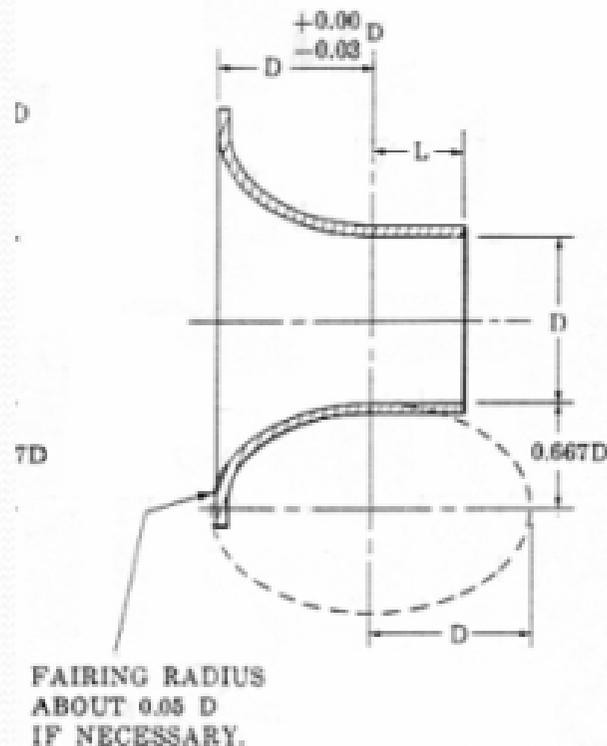

In this case, the maximum local velocity at a distance $0.1 M$ downstream of the screen shall not exceed the average velocity by more than 25% unless the maximum local velocity is less than 2 m/s (400 fpm).

From AMCA 210-99

AMCA 210 風洞設計標準

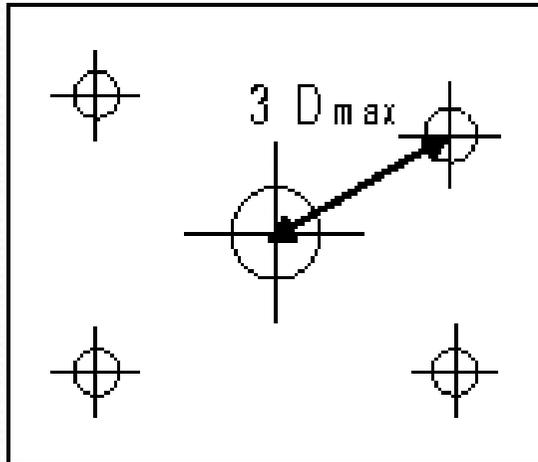

Notes

1. Nozzle throat dimension L shall be either $0.6D \pm 0.005D$ (recommended) or $0.5D \pm 0.005D$.
2. Nozzle shall have elliptical section as shown. Two and three radii approximations to the elliptical form that do not differ at any point in the normal direction more than 1.5% D from the elliptical form may be used. The outlet edge of the nozzle shall be square, sharp, and free from burrs, nicks or roundings.
3. The nozzle throat shall be measured (to an accuracy of $0.001 D$) at the minor axis of the ellipse and the nozzle exit. At each place, four diameters—approximately 45° apart must be within $\pm 0.002 D$ of the mean. At the entrance to the throat the mean may be $0.002 D$ greater, but no less than the mean at the nozzle exit.

AMCA 210 風洞設計標準

6.3.4 Multiple Nozzles.

Multiple nozzles shall be located as symmetrically as possible. The centerline of each nozzle shall be at least 1.5 nozzle throat diameters from the chamber wall.

The minimum distance between centers of any two nozzles in simultaneous use shall be three times the throat diameter of the larger nozzle.

The uncertainty of the airflow rate measurement can be reduced by changing to a smaller nozzle or combination of nozzles for the lower airflow rate range of the fan.

摘要

1. AMCA 210 標準簡介
2. 流量量測原理
3. 校正流程
4. 風洞特點
5. 風扇PQ比較
6. 應用案例

流量量測原理

Bernoulli's equation

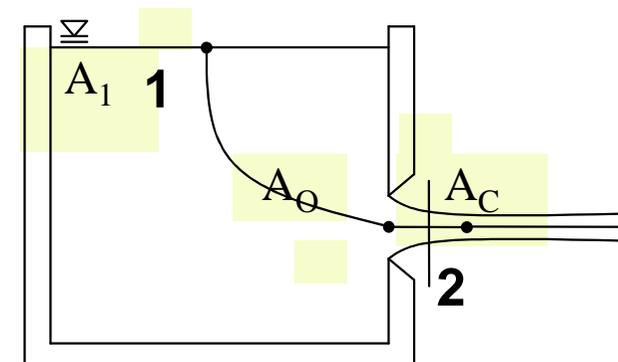

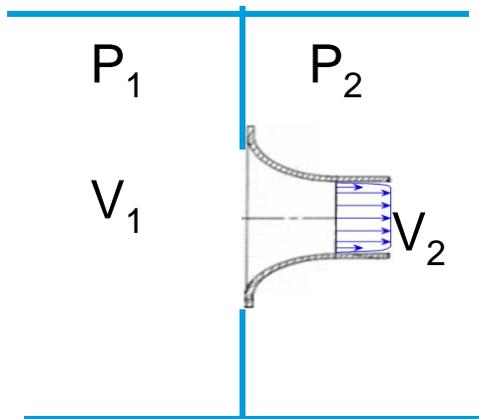

$$P_1 + \frac{1}{2} \cdot \rho \cdot V_1^2 = P_2 + \frac{1}{2} \cdot \rho \cdot V_2^2$$

$$V_2 \gg V_1 \quad V_2 = \sqrt{\frac{2 \times (P_1 - P_2)}{\rho}}$$

$$Q_{\text{real}} = C_d \times V_2 \times A$$

C_d : discharge coefficient

A : nozzle throttle area

流量量測原理

How to get the Cd ?

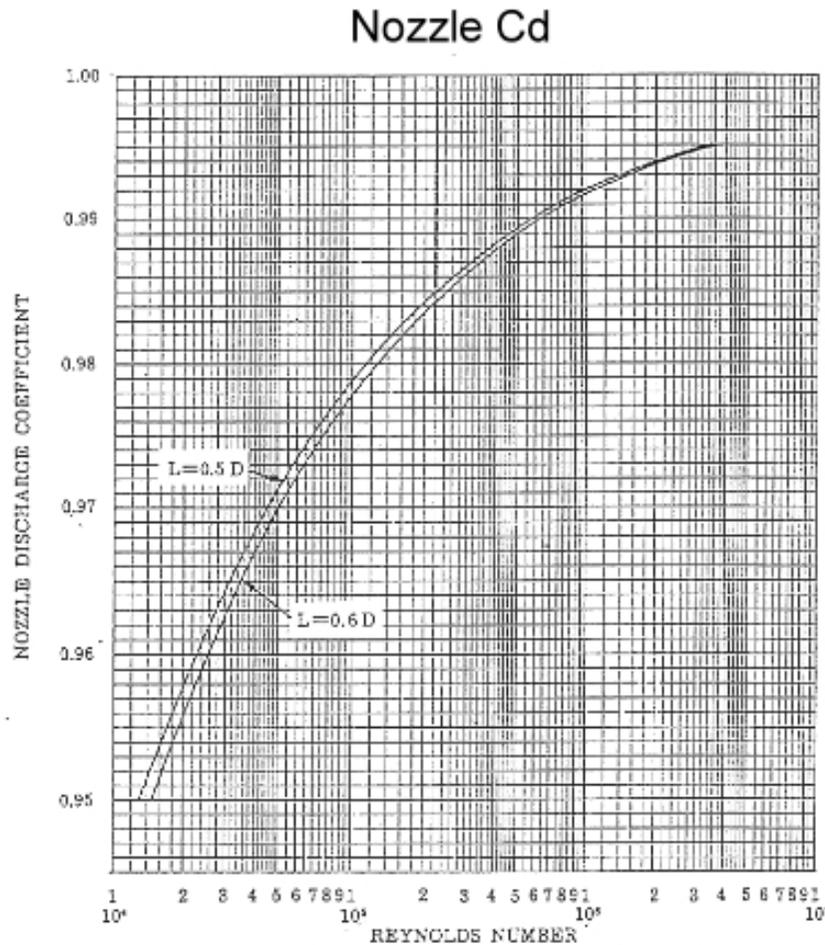

Figure 18 Coefficients of Discharge For Flow Nozzles

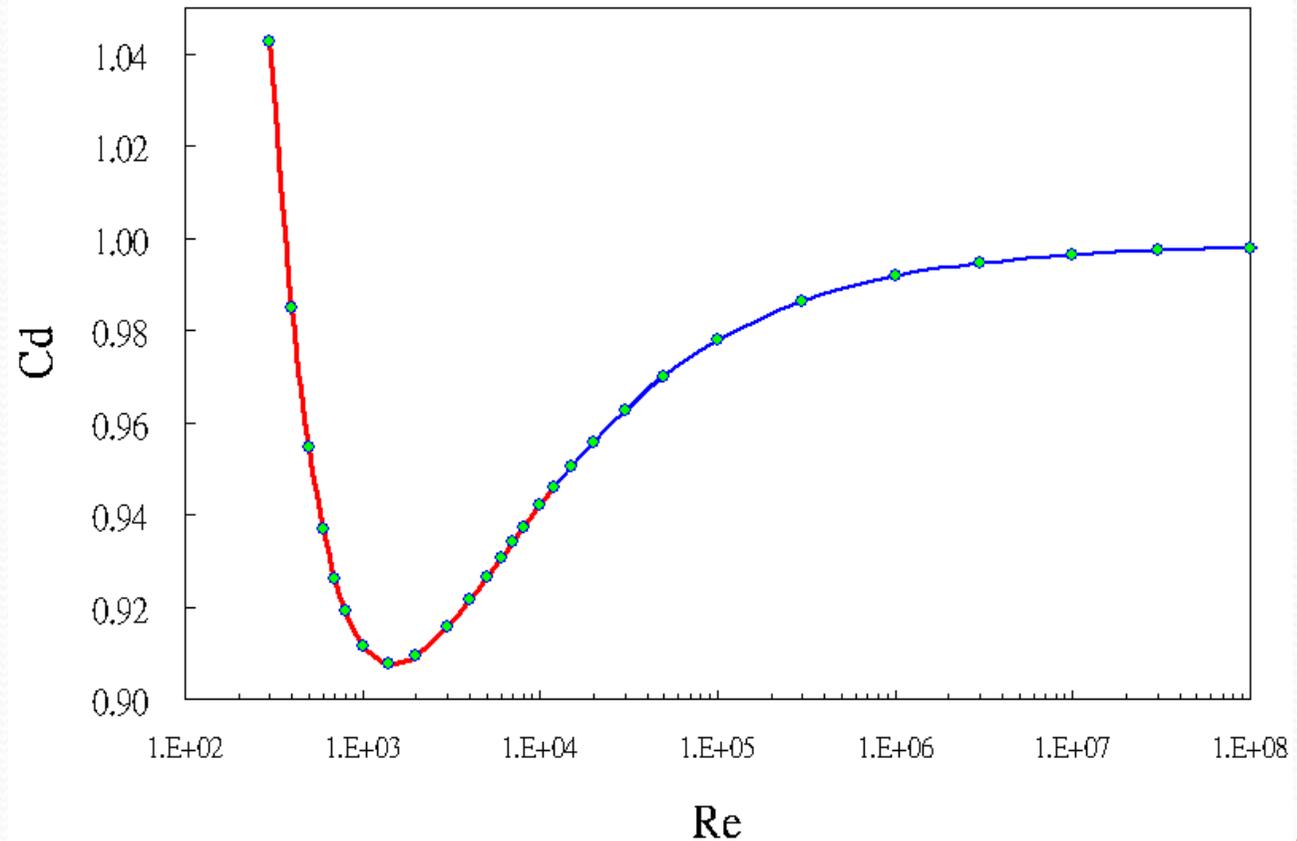

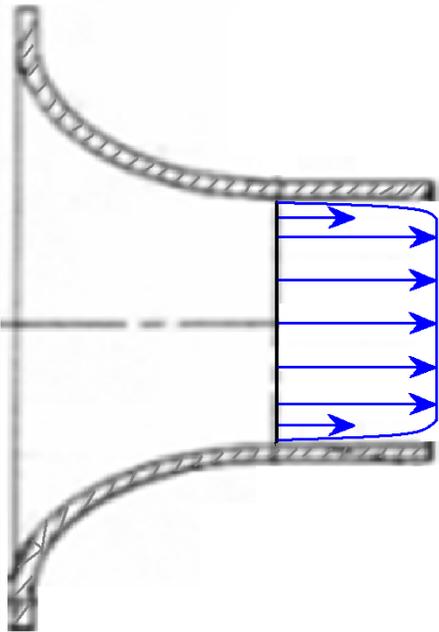

$$C_d = 0.9986 - \frac{7.006}{\sqrt{Re}} + \frac{134.6}{Re}$$

$$Re = \frac{D_n \cdot U_n}{\nu}$$

流量量測原理

From AMCA 210 Standard

$$C_d \text{ for } Re > 12000 = 0.9986 - \frac{7.006}{\sqrt{Re}} + \frac{134.6}{Re} \quad \text{for } \frac{L}{D} = 0.6$$

流量量測原理

Cd calculation formula

$$C_{d_{Re>12000}} = 0.9986 - \frac{7.006}{\sqrt{Re}} + \frac{134.6}{Re} \quad \text{for } \frac{L}{D} = 0.6$$

Cd modify equation :

$$C_{d_{Re<12000}} = 0.999976 - \frac{5.922888}{\sqrt{Re}} \quad \text{for } \frac{L}{D} = 0.6$$

LW-Series Air Flow Rate & Pressure Measurement Apparatus

Meeting AMCA 210-99 Standard

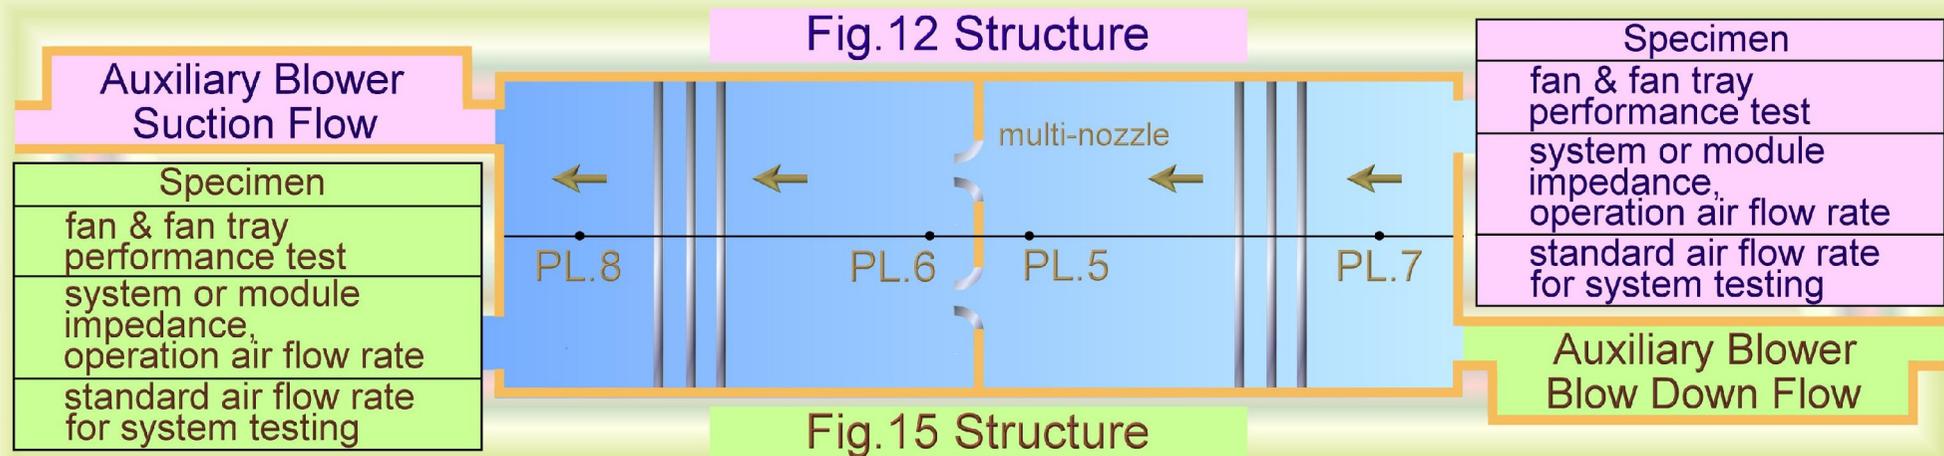

Including Fig.12 & Fig.15 Structure

design & manufacturer : Long Win Science & Technology Corporation

Web site : <http://www.longwin.com>

Tel : 886-3-464-3221

Fax : 886-3-496-1307

Features

- fan performance, PQ curve, blade design, electric function
- system & module impedance
- offer operation air flow rate set up T-Q / R-Q chart

Measurement Item

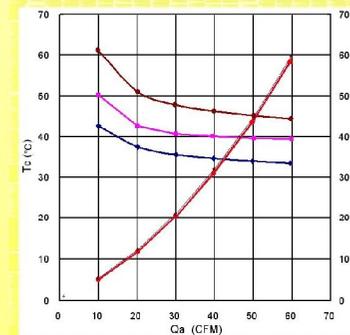

- air flow rate : series 2.4 ~ 3000 CFM
- accuracy : 1 ~ 3.5% INFS full scale of indicated nozzle
- I , V , rpm of Fan

Air Flow Rate Calculation

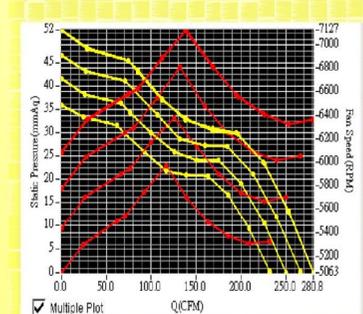

$$Q = C_d \cdot \Sigma A \cdot U$$

Q : air flow rate
 ΣA : nozzle area
 C_d : discharge coefficient
 $1/2 \rho U^2 = \Delta P = P_{56}$
 $\rho_{air} = f(T_d, T_w, T_c, P_{PL.5})$
 $C_d = f(Re)$
 $Re = f(D, U, \mu, \rho)$

RQ Chart

PQ Chart

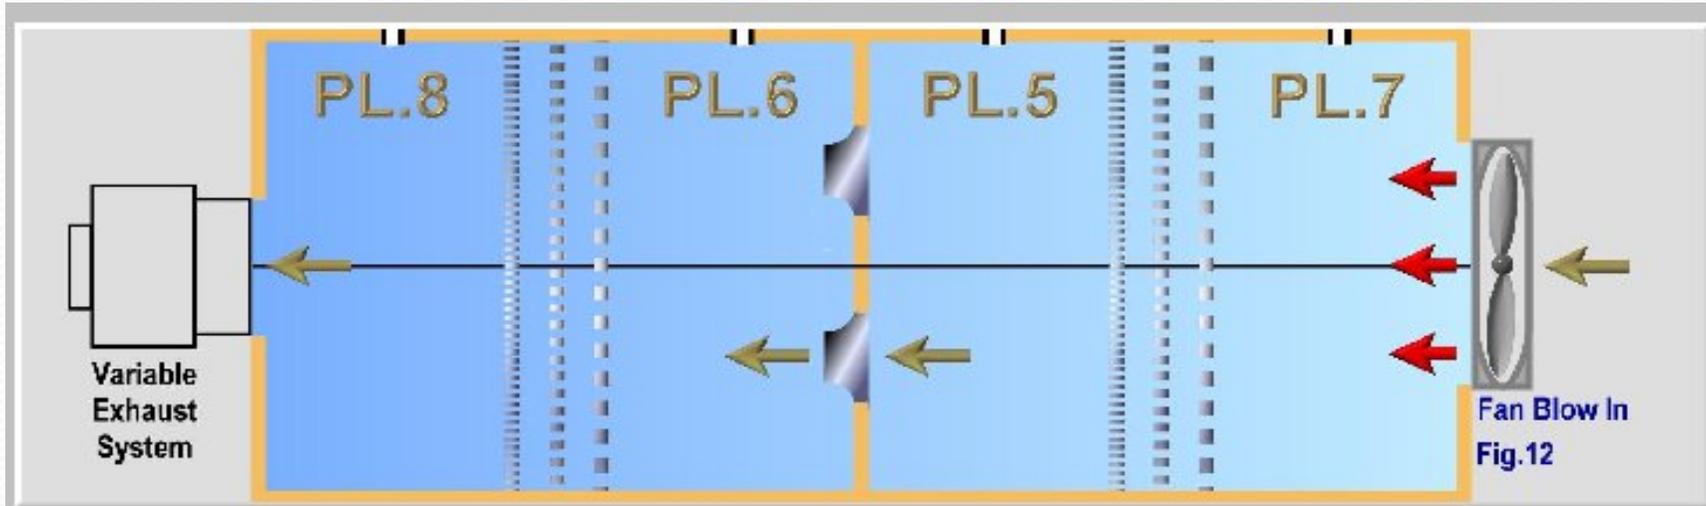

Fig.15 Inlet Chamber

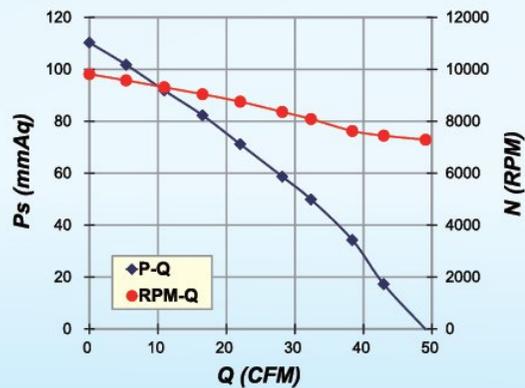

- D. Fan Performance Curve - FPC
- E. System Resistance Curve - SRC
- F. Airflow / Thermal Resistance - TRC

Fig.12 Outlet Chamber

- A. Fan Performance Curve - FPC
- B. System Resistance Curve - SRC
- C. Airflow / Thermal Resistance - TRC

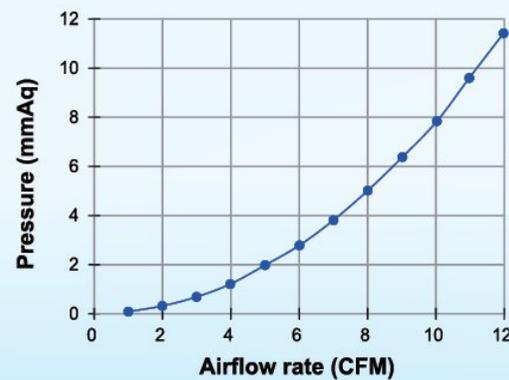

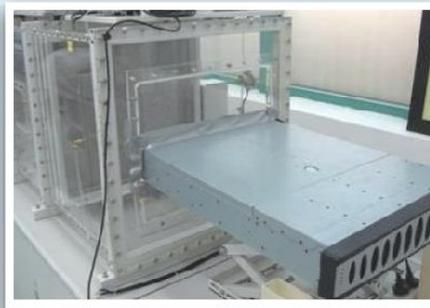

PQ curve

- The fan performance curve with pressure (P) and airflow rate (Q).

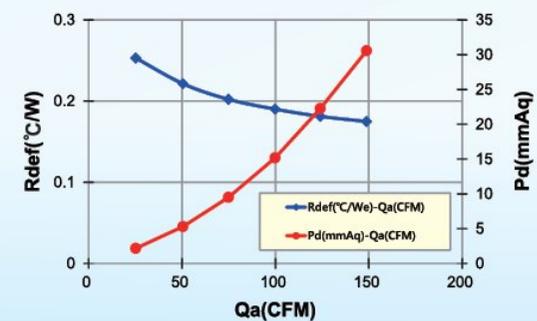

SRC curve

- Applicable to system resistance measurement for PC, Notebook, and server.

RQ curve

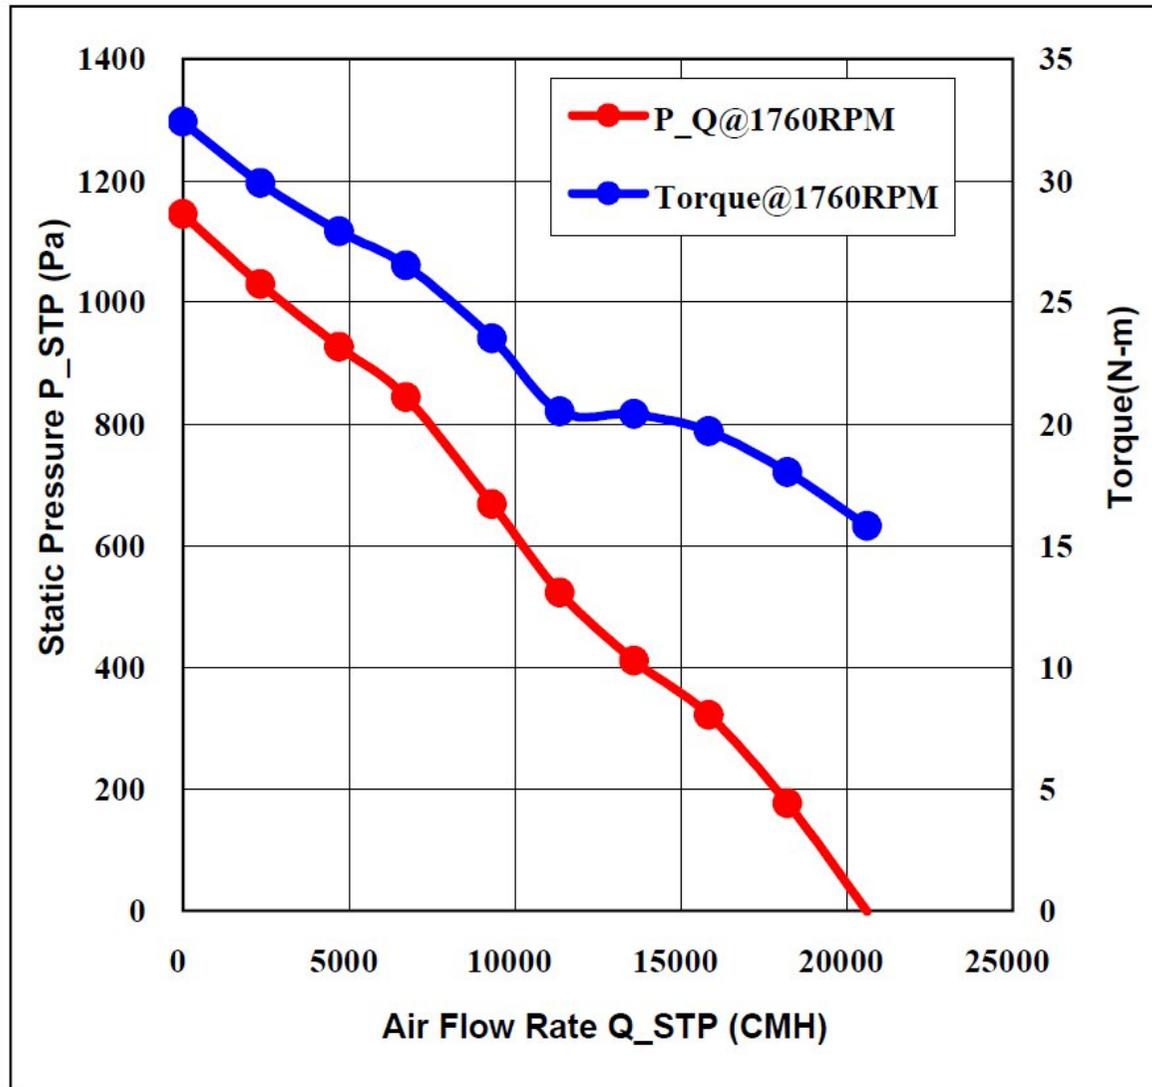

- To analyze thermal resistance (R) and the correlation of P and Q. A thermal wind tunnel or standard TTP can be cooperated.

風扇PQ五種測試模式

Constant Volt

PWM

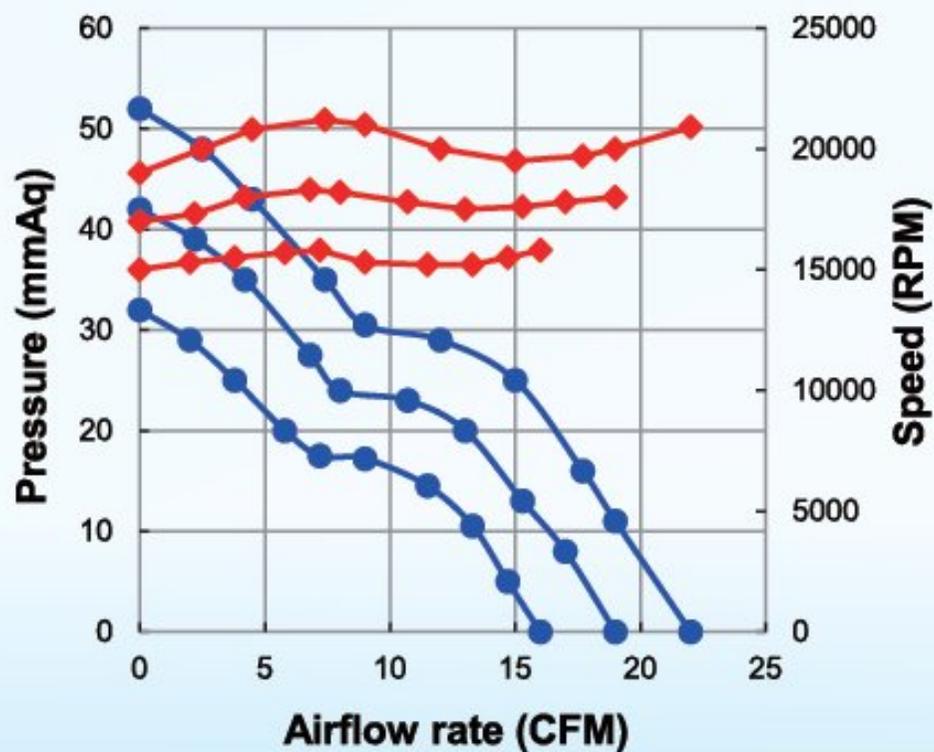

Constant RPM

Cpk

Operation Point Check

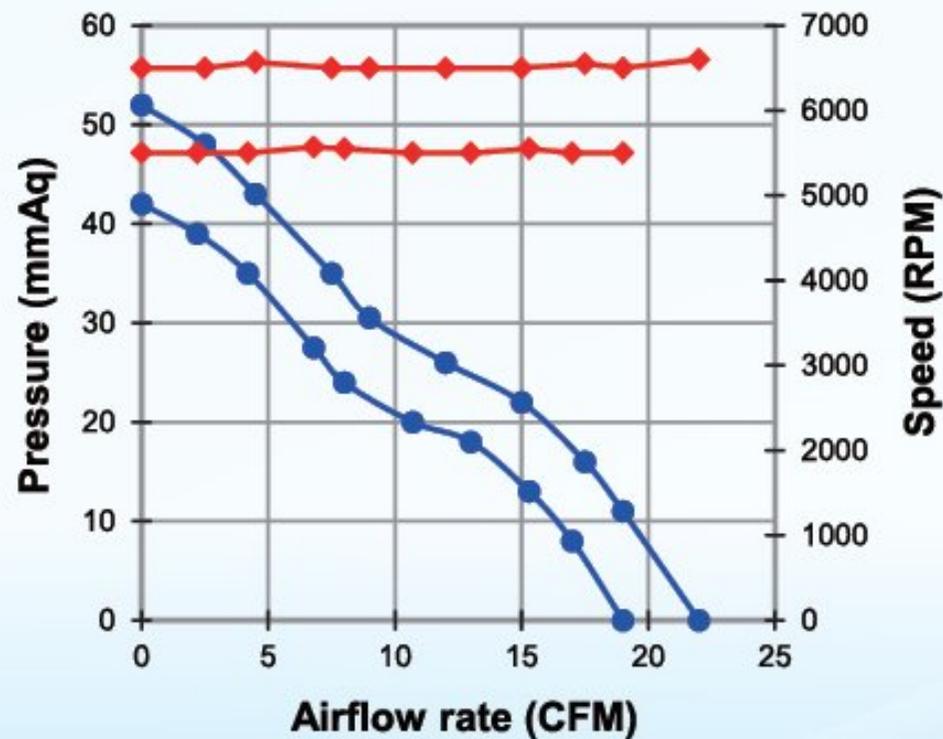

Constant voltage

- Apply certain DC or AC power to specimen.

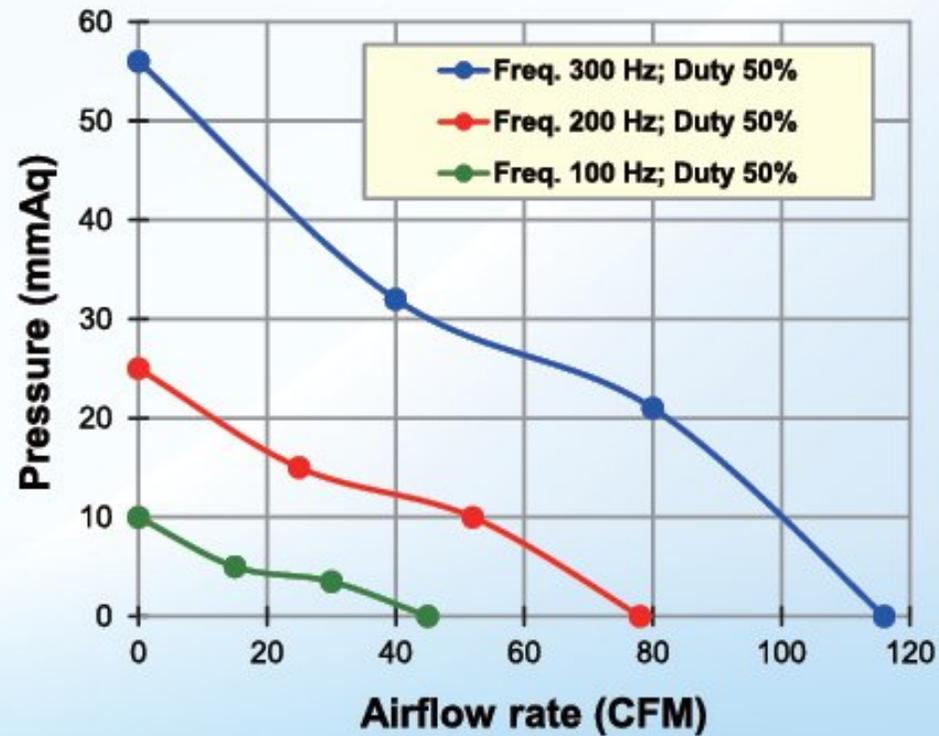

Constant RPM

- RPM can be controlled by DC voltage or PWM.

PWM mode

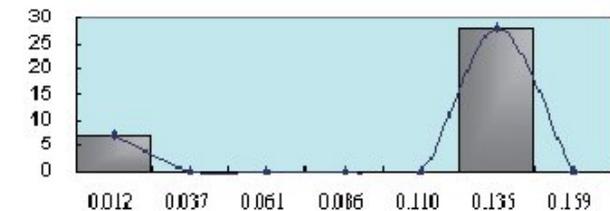

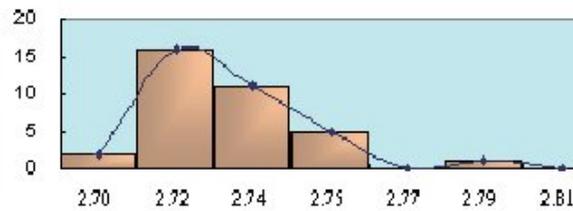

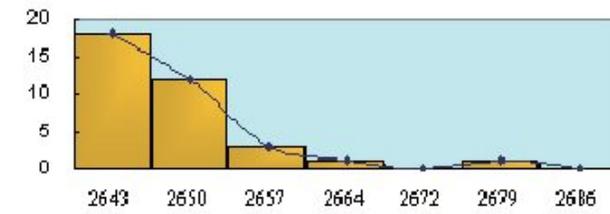

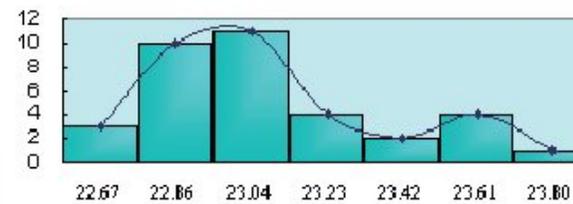

- Adjusting frequency and duty cycle under a constant DC voltage.

Cpk mode

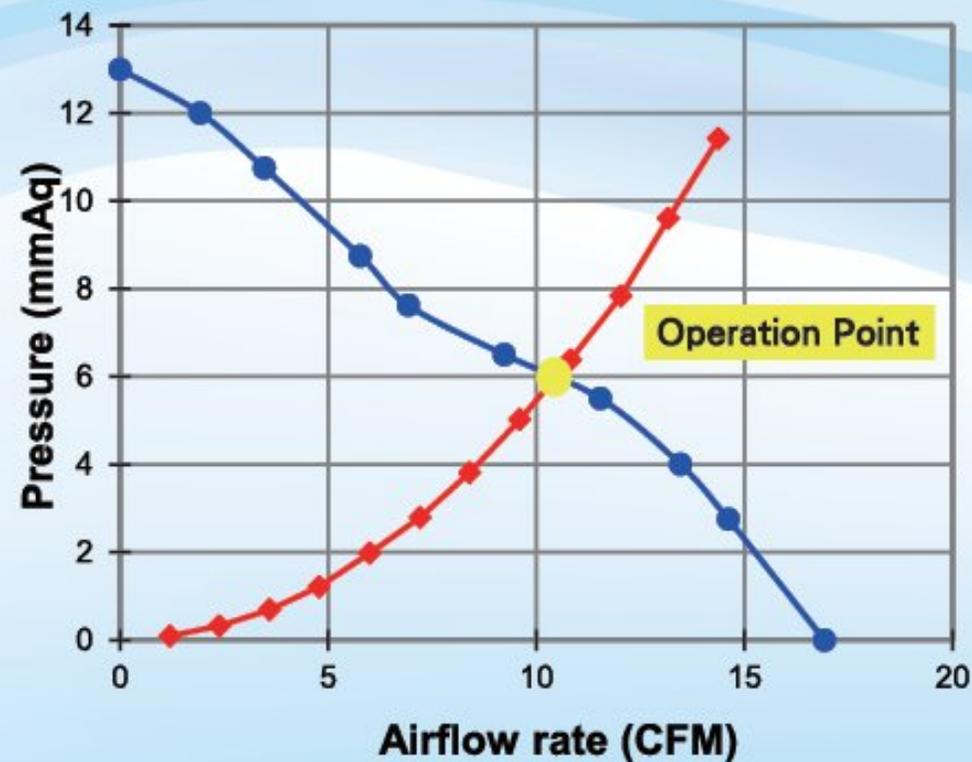

- A statistical method to analyze the mass production performance while doing quality assurance.

軸向力及扭矩量測	—	--	—
長 x 寬 x 高 (cm)	160 x 60 x 140	220 x 70 x 160	260 x 80 x 190
淨重 (kg)	380	400	550
使用電力	AC 220V 5 Amp 單相	AC 220V 5 Amp 單相	AC 220V 10 Amp 三相

LW-9014 (18CFM)& 9081 (60CFM)

LW-9015 (250 & 400CFM)

LW-9185 (800&1000 CFM)

LW-9185 (1500 CFM)

LW-9120 (2000~8000 CFM)

LW-9293 (20,000~30,000 CFM)

LW-9545 (2100 CFM, Ps~800mmAq)

LW-9266 (~250 CFM)

LW-9348 (~1000 CFM)

摘要

1. AMCA 210 標準簡介
2. 流量量測原理
3. 校正流程
4. 風洞特點
5. 風扇PQ比較
6. 應用案例

應用

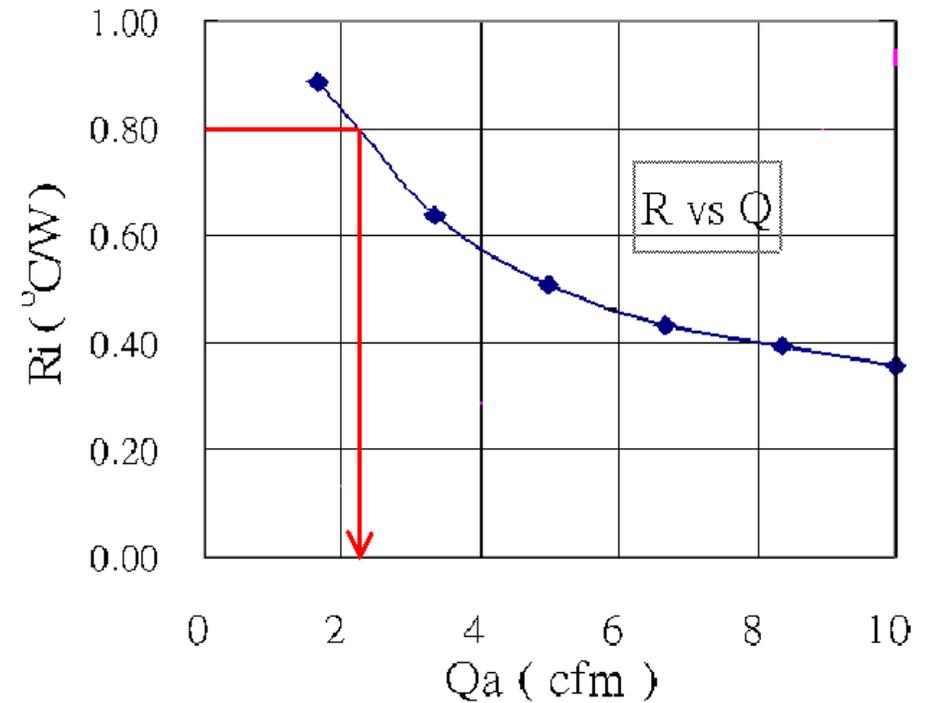

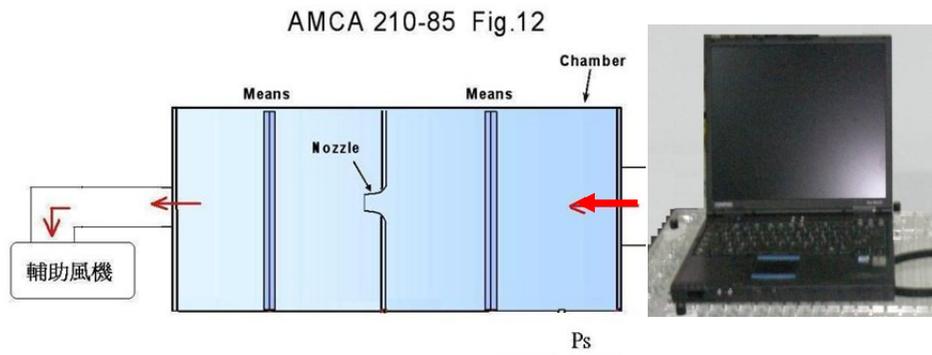

NB Thermal Design

Step1 :

Worst case

Define mini air flow rate

NB
Power ON

Offer Air Flow Q_{air}

Temperature
Data Log

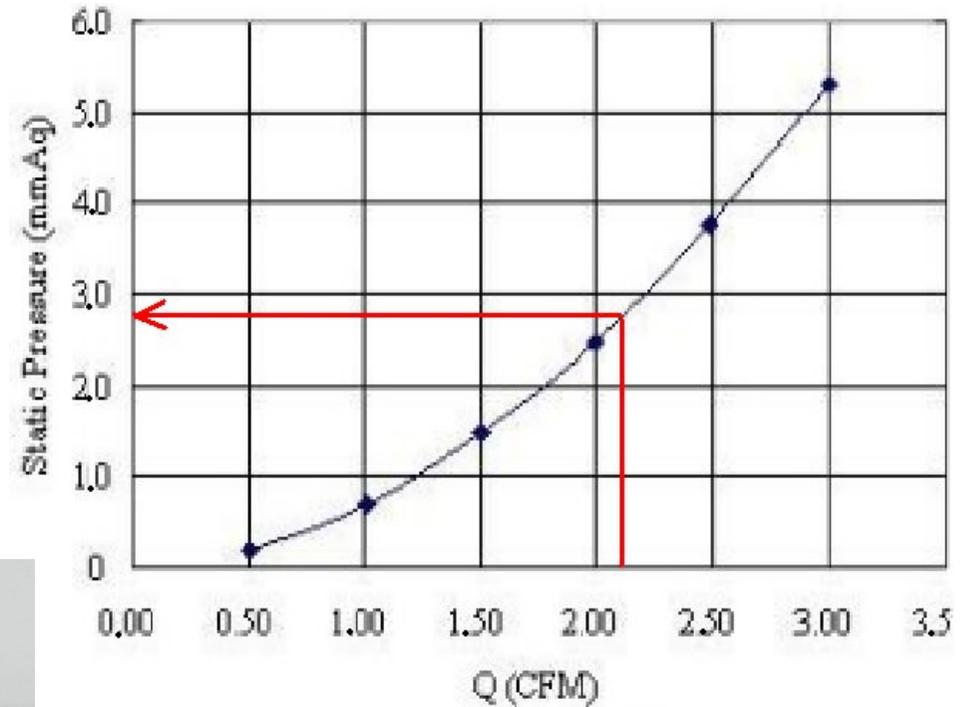

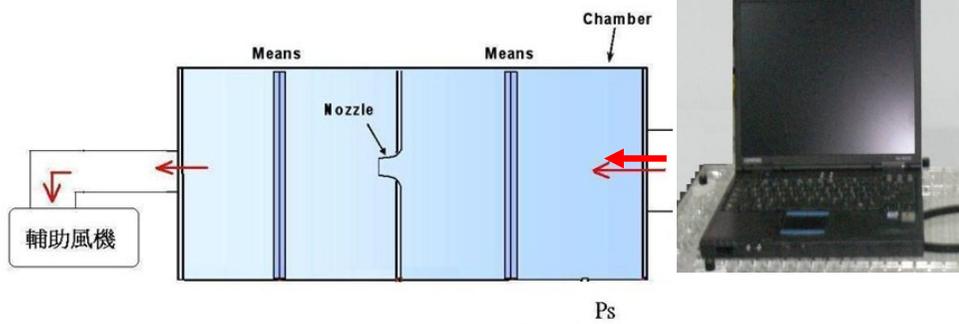

應用

NB Thermal Design

Step2 :

NB
Flow Impedance

AMCA 210-85 Fig.12

應用

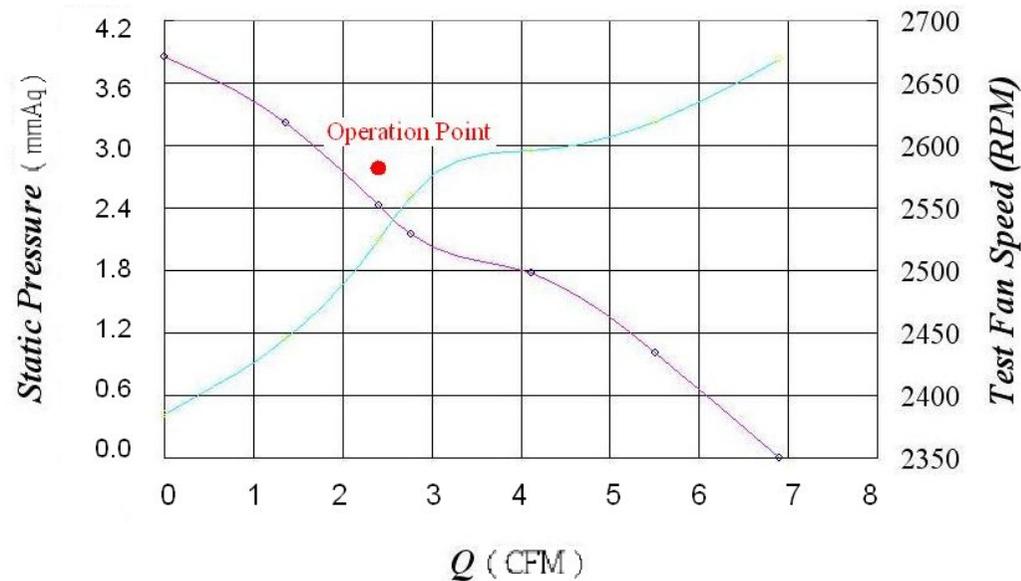

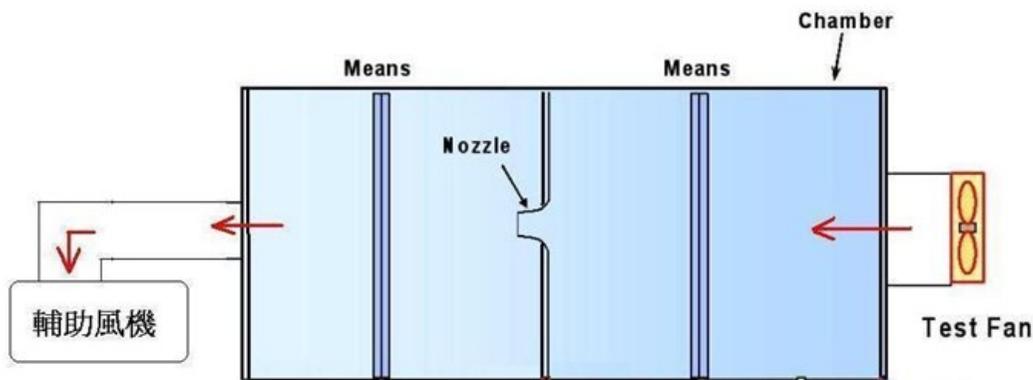

NB Thermal Design

Step3 :

Step 3

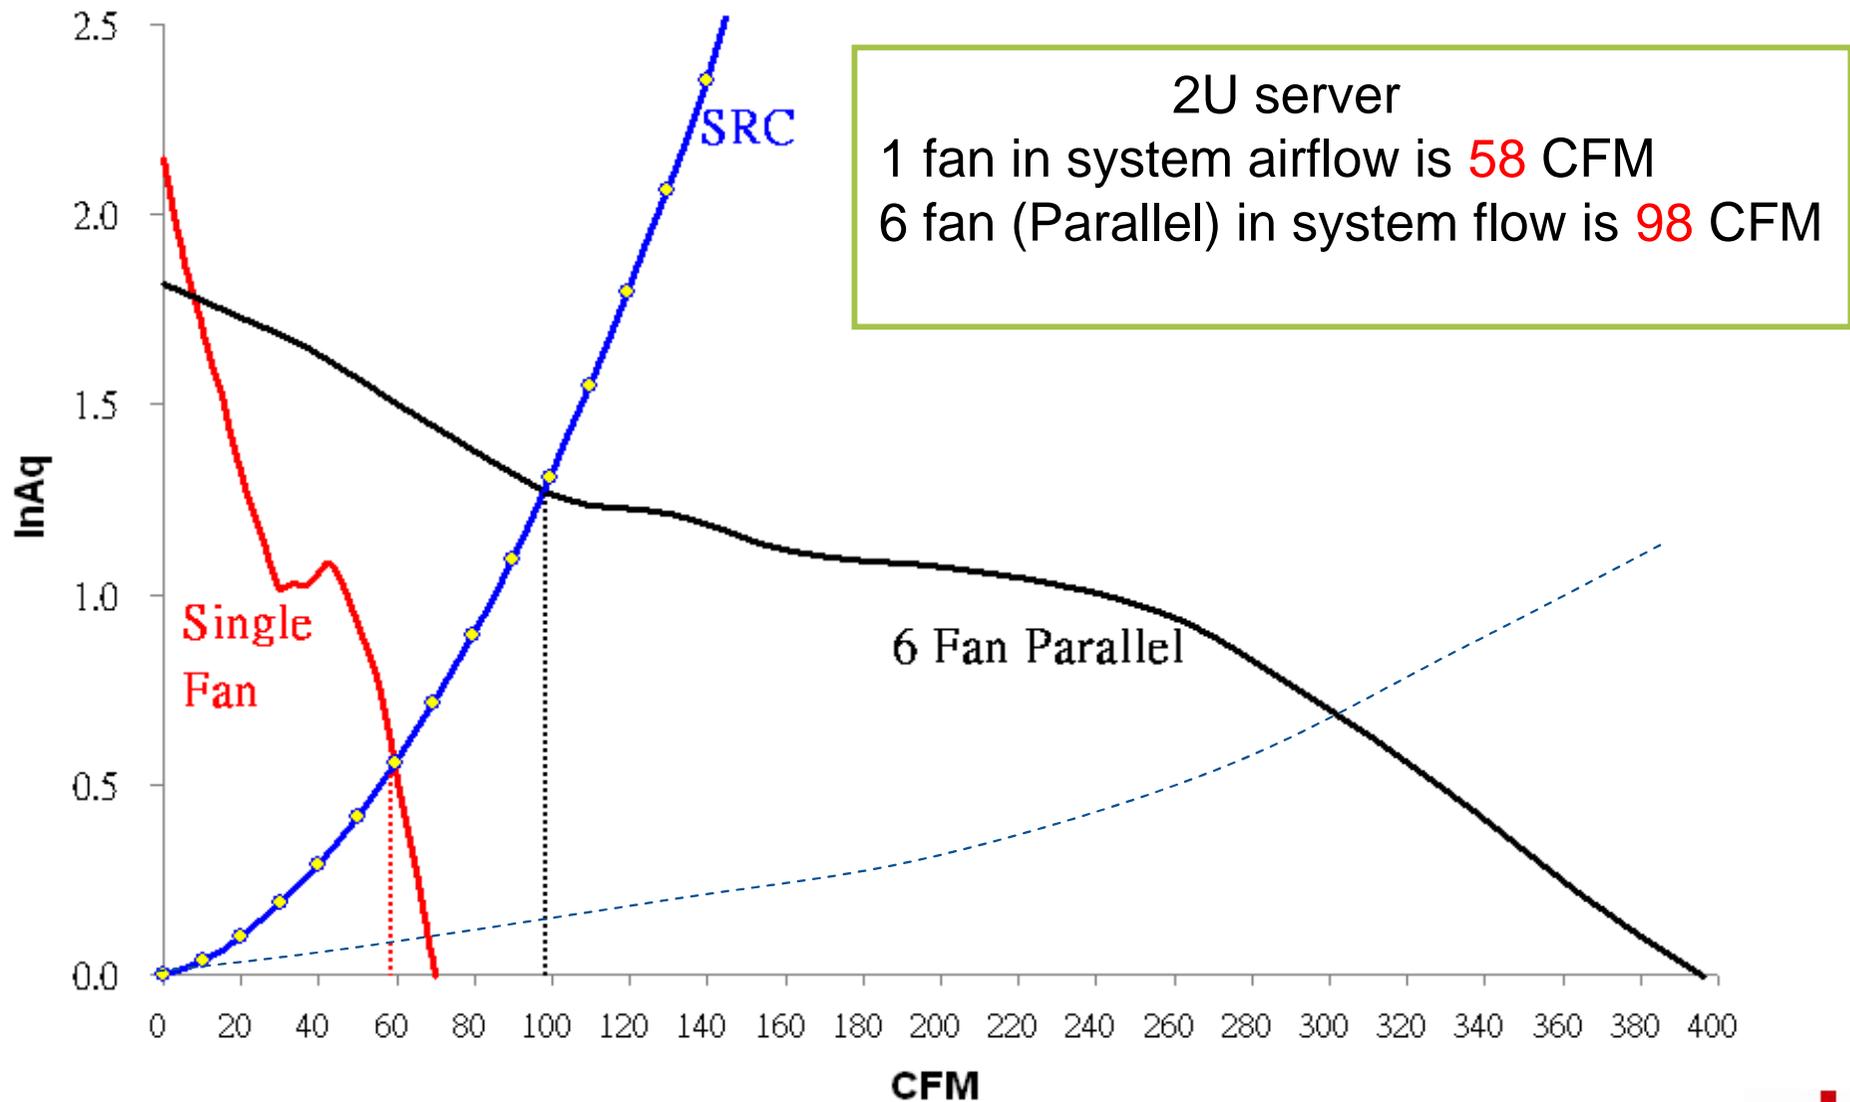

NB
Blower

AMCA 210-85 Fig.12

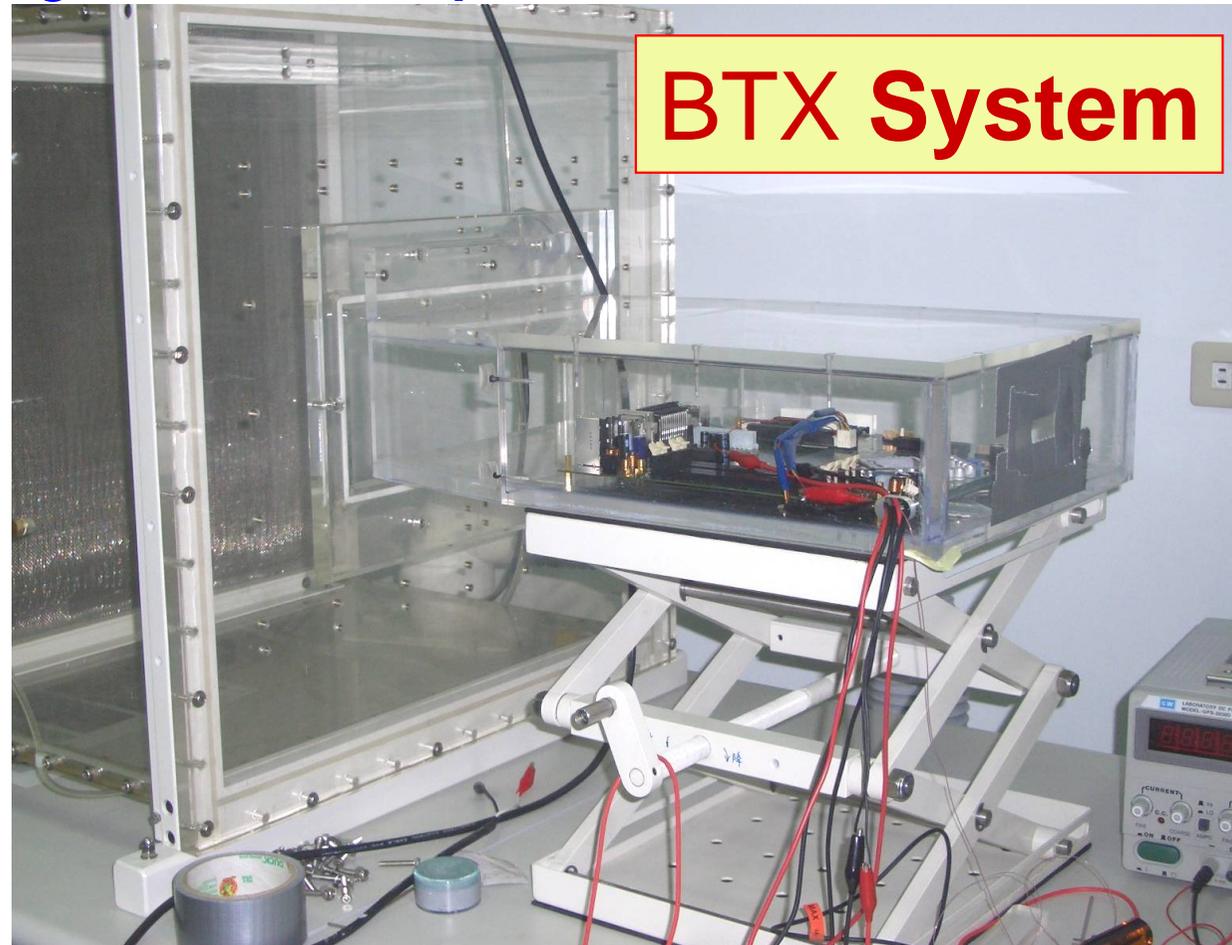

應用

Server fan tray case study

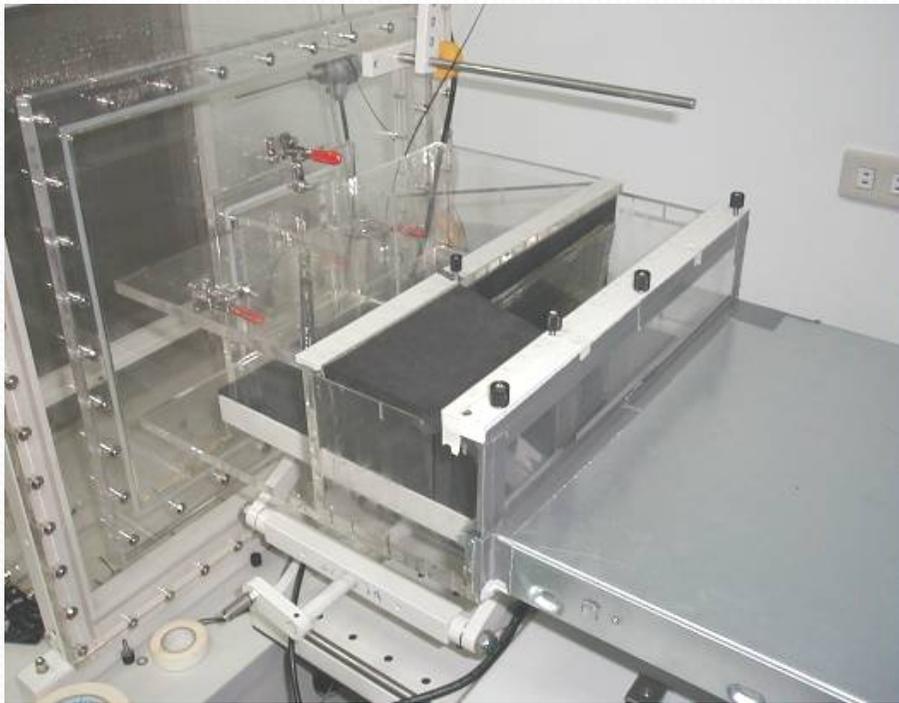

應用

System Impedance Test

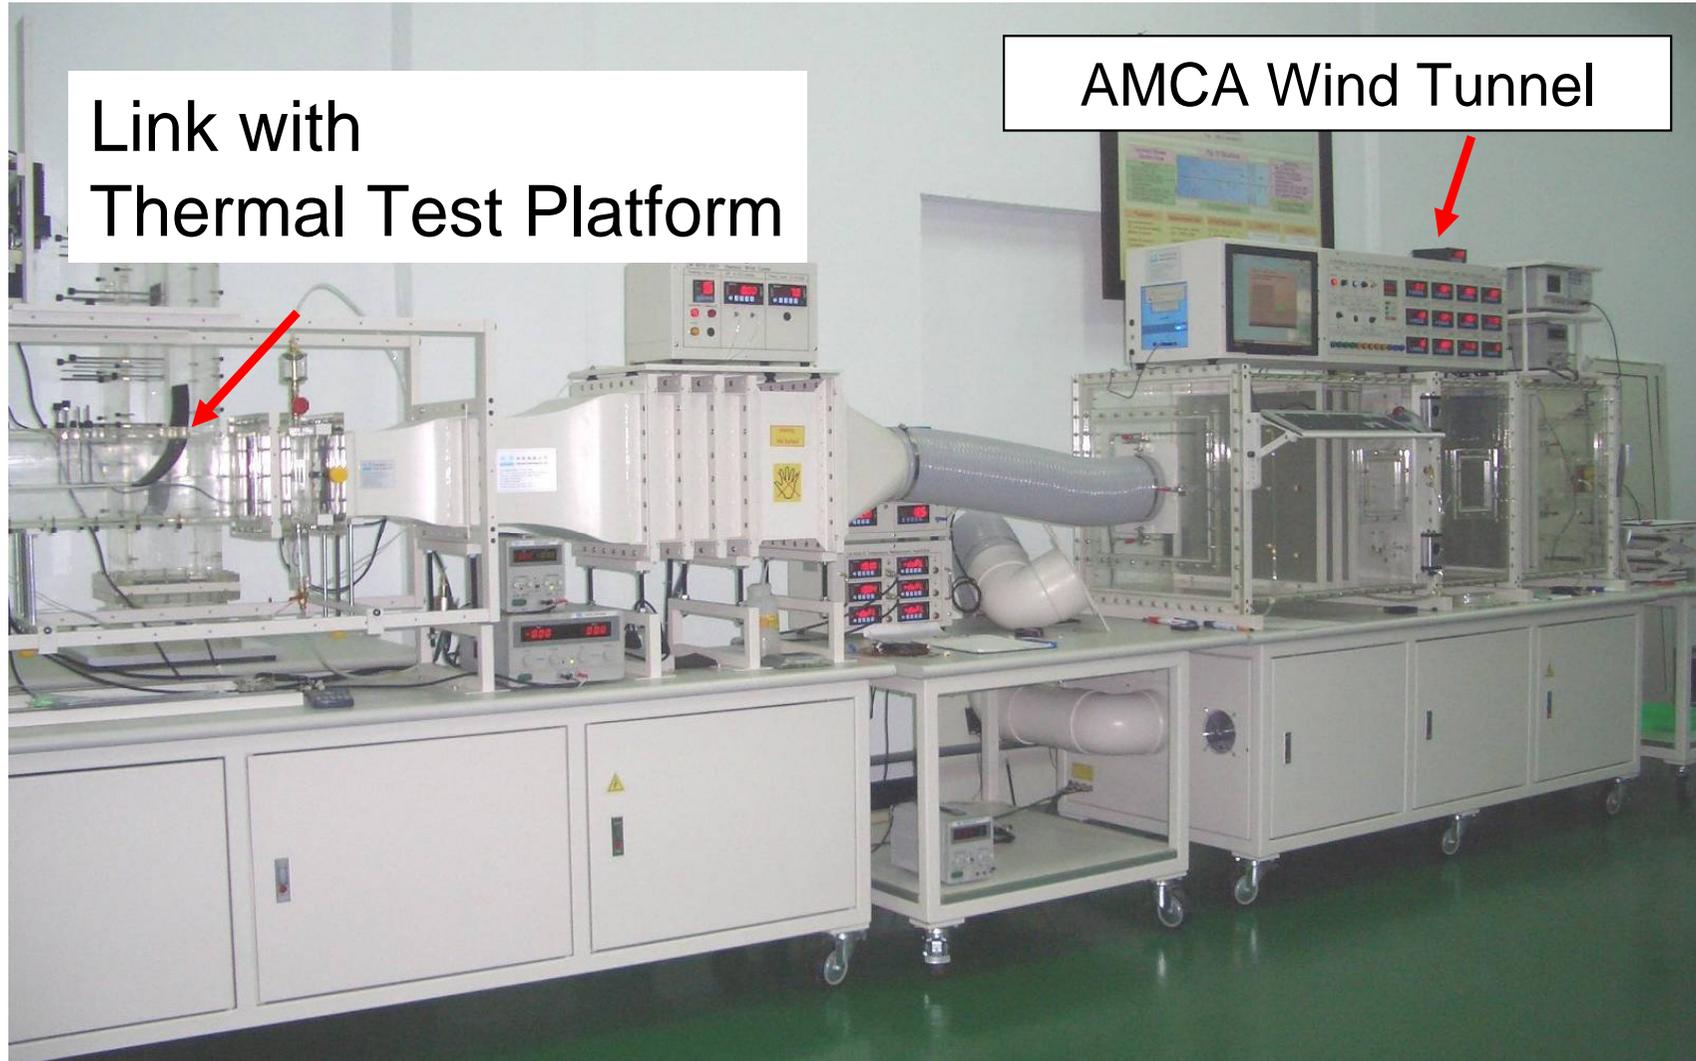

應用

Server Thermal Test , Impedance Test, Airflow Test

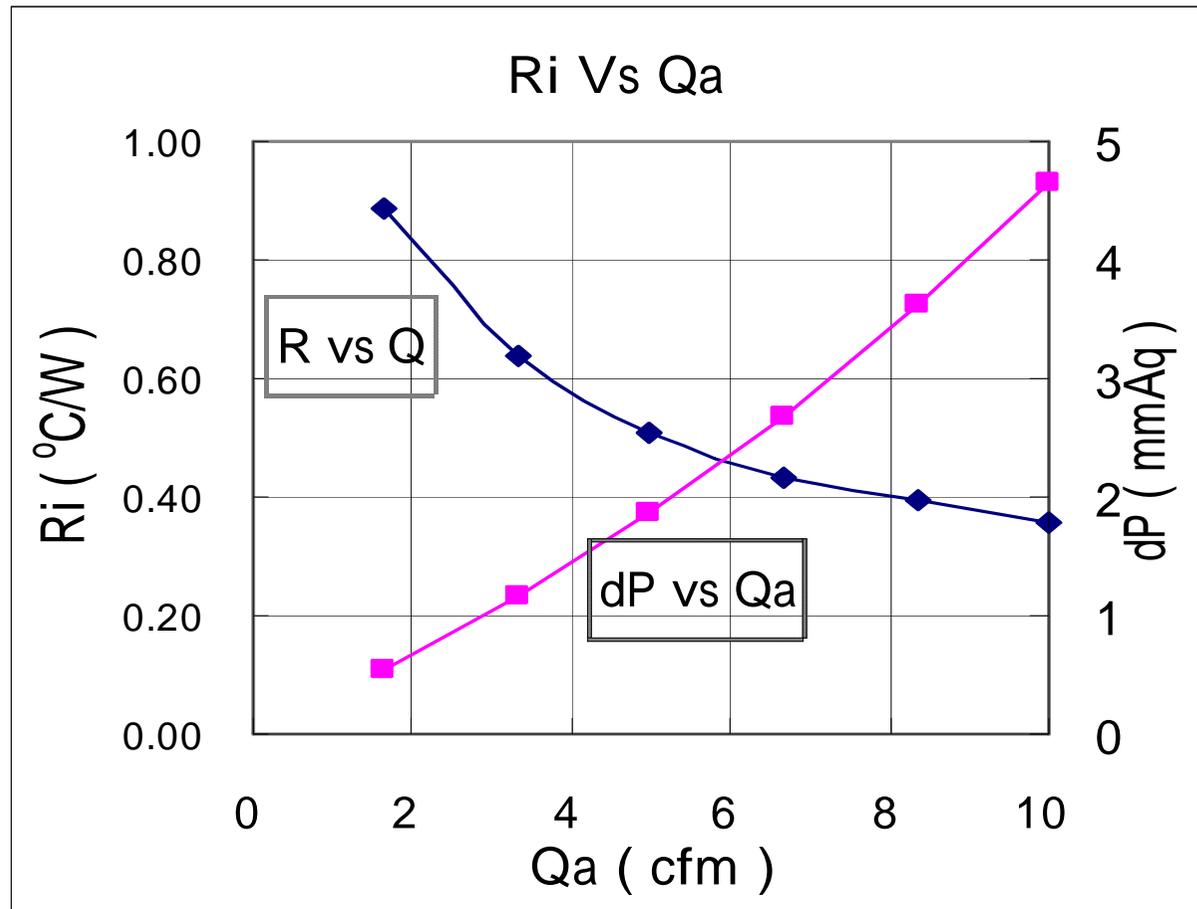

應用

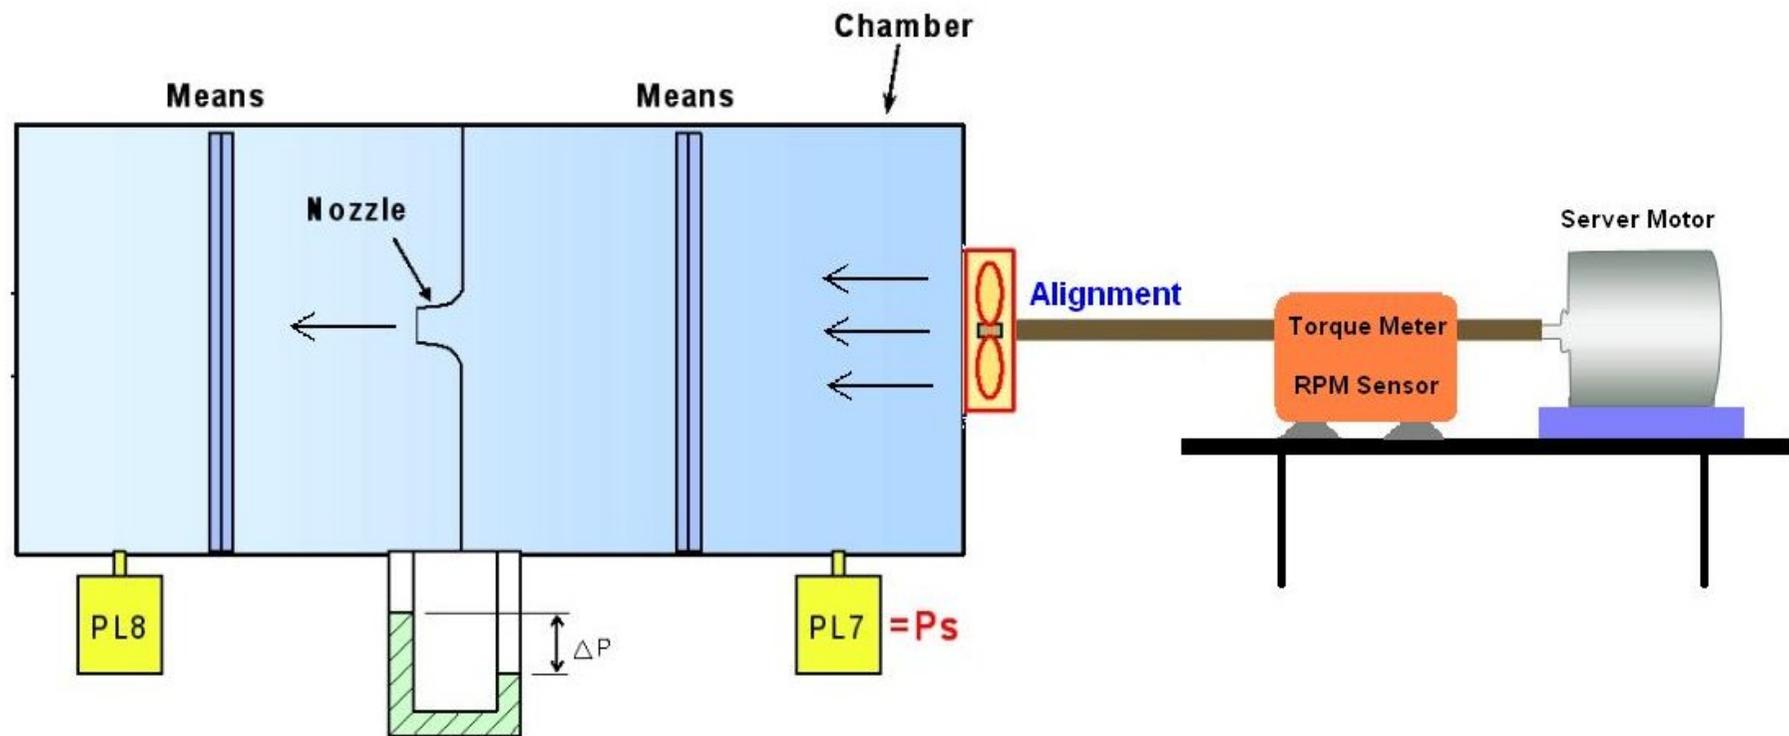

應用

Thermal Module - Thermal Resistance Curve Test

應用

AMCA 210-99 Fig.12

Thank you !
